Moreover, this association is borne on a large autosomal chromosome that is seemingly identical in both. The mesostyle does not protrude buccally.

**An early Oligocene fossil demonstrates treeshrews are slowly evolving “living fossils”**

More observations need to be made, but there is strong evidence that large tree shrews have this kind of parental care system as well. It is located mesiobuccally relative to the paracone. Proc Natl Acad Sci USA.

**Arbor: Comparative Analysis Workflows for the Tree of Life**

In an unscaled tree, the branch length is not proportional to the amount of evolutionary divergence, but usually the actual number is indicated somewhere on the branch. The metaconid is also in a shape of triangular pyramid, but more rounded and slender than the protoconid. Tupaia tana is somewhat unique in that it finds much of its food under the first layer of soil by using its claws to dig and its snout to search.

**Introducing the Treeshrews: They Don't All Live in Trees and They Aren't Close to Shrews**

The major distinction between a branch and a leaf of the Tree of Life is that each branch can be further subdivided into descendent branches, that is, subgroups representing distinct genetic lineages. Diagnosis Tree shrew similar to P.
