Local System Account

If this is successful, the NetNTLM for the SQL service account can be collected and potentially cracked or relayed to compromise machines as that service account.

Windows & Active Directory Exploitation Cheat Sheet and Command Reference :: Cas van Cooten — I ramble about security stuff, mostly

It starts when some application calls for it or when an administrator starts it from the Services snap-in or from the command prompt. Obviously, not all services need this much access, and I would venture a guess that most do not. If the certificate is only imported to the Local User Trusted Root CA store, the downstream WSUS server will not be authenticated on the upstream server.

Local System Account

If you are using signed certificates from a public Certificate Authority CA or have already trusted the root certificate that issued the SSL certificate you are using, you should be fine for the downstream servers.

Enabling SSL on Windows Server Update Services (WSUS)

After all, while we may not like it, the best security practices have to be tempered against system managability.

Enabling SSL on Windows Server Update Services (WSUS)

You can also enable or disable any service from a particular hardware profile. You check your server and perform basic tests, but you will only see a high amount of network traffic with resources maxed out.

Windows & Active Directory Exploitation Cheat Sheet and Command Reference :: Cas van Cooten — I ramble about security stuff, mostly

If that is the case, then it is what it is.

Windows & Active Directory Exploitation Cheat Sheet and Command Reference :: Cas van Cooten — I ramble about security stuff, mostly

There are several factors to consider before selecting which of these approaches should be used including the size of your shop, the number of database administrators in the shop in this context anyone who has the passwords that the SQL Server runs under is counted as a database administrator , and how complex the application design is, and how often you plan on changing service account passwords. This means that the frontend service needs to have an SPN set. This clearly illustrates why you should control the context of services.

DDoS monitoring: how to know you're under attack

While on newer versions of Windows such as Windows 2008 and higher this is less of a problem, on older versions of Windows this is an unacceptable security risk.
