Developing a thorium-based fuel cycle Thorium fuel cycles offer attractive features, including lower levels of waste generation, less transuranic elements in that waste, and providing a diversification option for nuclear fuel supply.

Although open pit mining link to mining solution page contributes about 85% of all mineral mining, it is one of the most environmentally taxing. Rare earth elements are heavily used in all of these industries, so the demand for them should remain high.

Thorium

Fuel rods containing thorium additive Th-Add and also thorium MOX with Pu fuel rods were tested in a five-year irradiation trial that started in April 2013 at the Halden test reactor.
