Frontiers in Medicine

A total of 336 patients with biopsy-confirmed DKD who were followed up for at least 12 months were enrolled. Finally, potential future therapies are proposed, focusing on interventions that may prevent or diminish the development of the microvascular and microcellular endothelial dysfunction. The prognosis of the kidney was compared by the log-rank test and shown using the Kaplan—Meier curve.

Frontiers in nephrology: Early atherosclerosis

The study provides relatively strong evidence to illustrate the associations.

Frontiers in nephrology: Early atherosclerosis

As with many disciplines in medicine, nephrology has greatly benefited from recent scientific and technological advances, allowing nephrologists to improve diagnostics, therapy and treatment, ultimately leading to improved patient care.

Frontiers in Neurology

The meeting will gather a global panel of clinical and scientific expertise and will bring together clinicians, scientists, academics, and general practitioners to share and present the latest developments in terms of differential diagnosis, disease classification, genetics, and identifying knowledge gaps and unmet treatment needs.

Moreover, studies have found that the effect of sex is less apparent in DKD than in non-DKD. Endothelial dysfunction is an established clinical marker of early coronary artery disease and has been shown to be associated with increased cardiovascular morbidity and mortality. Increasing studies have investigated the effect of sex differences on DKD development and progression, however, but different cohorts have reported conflicting findings.
