Functional Test Systems and Automated Test Equipment

Addressing semiconductor test challenges Extended battery lifetime for mobile devices lead to shrinking supply voltages and require precision force and low leakage measurement capabilities during test. So digital twins are constantly learning new skills and capabilities, which means they can continue to generate the insights needed to make products better and processes more efficient.

Each set of sectors can be bridged together within the test head card cage on an application-by-application basis.

What is a digital twin

With high density cards, universal features and precision force and measurement capabilities the PAC solution enables leading CoT savings at high site count testing. The scalable design is a key capability to enable outstanding device portfolio coverage and test cost advantages in one single test platform.

Improvements were also noticed in other health indicators such as mean blood pressure, adherence to antihypertensive medication, intake of dietary salt by hypertensives, intention to quit tobacco, and vitamin A supplementation. However, the core idea of using a digital twin as a means of studying a physical object can actually be witnessed much earlier. The ETS-88 test system hardware is designed to provide independent floating resources per site to avoid resource sharing across sites while improving site-to-site isolation and measurement accuracy.

Eagle Test Systems ETS

These services can address product and process requirements ranging from a single board to systems level testing.

Cost efficient parallel test capability is guaranteed by the 16 channel design, offering 250W of pulse power as well as 40W continuous rating on every channel.
