Tropical Cyclones : Climatology and Impacts in the South Pacific by James P. Terry (2007, Hardcover) for sale online

Meteorological and climate analysis centres across the Southwest Pacific are indicating near average numbers of tropical cyclones TC for the 2016 —17 season November 2016 to April 2017. There is a strong latitudinal gradient throughout the central and western SPO, with little longitudinal variation, for all phases of ENSO. The second interpolation involves the distribution of data from the observed and interpolated positions using a Cressman weighting.

On the 19 December, RSMC Nadi reported that cyclone Evan had weakened below cyclone intensity and declassified it as a tropical cyclone.

Tropical Cyclones: Climatology and Impacts in the South Pacific

To find past analogs that describe the climate state leading into the upcoming TC season, the past May-September conditions were examined for the tropical Pacific from 1969 to the present. Major Hurricane Strikes 1900-2010 U.

A significant roadblock to our understanding of past variability and trends in tropical cyclone activity resides in temporal heterogeneities present within the historical best track data. On the other hand, La Niña years are associated with reduced vertical wind shear in the region, which increases the likelihood of tropical cyclone formation e. Some unique characteristics are apparent during La Niña years in the zonal component of the transport vector fields, with a strong westward region in the Coral Sea in the far west of the SPO, forming part of a larger-scale region of curvature in the transport fields around this

area. The rather small standard deviation of the annual global storm count, compared to the mean, has led to the commonly held view that the annual global count is more stable than might be expected given the large interannual variability present in individual basins; however, Frank and Young found contradictory evidence of this, demonstrating that the global variability of storm numbers is in fact indistinguishable from that when each basin was examined independently of the others.
