## Textbook of Venereal Diseases and Treponematoses—Second Edition

From the moment WHO was established in 1948, the control of venereal diseases was felt to deserve highest priority, together with activities to control malaria and tuberculosis. WHO immediately set up a global programme for the control of STDs and, with the participation of other agencies, especially UNICEF, furnished countries with assistance in the form of personnel, equipment and funds for the operation of programmes to assess the extent and impact of STDs and to plan and implement practical measure of control. Patients do not develop lifelong immune resistance.

A selection will be made from these for review, precedence being given to new books and to those having the greatest interest to our readers. The endemic, or nonvenereal, treponematoses are infections caused by bacteria that are closely related to *Treponema pallidum pallidum*, the etiologic agent of venereal syphilis. THE second edition of this comprehensive work has been carefully revised and the author rightly points out that the availability of effective treatments alone is not sufficient to control venereal diseases.

## Chapter 201. Endemic (Nonvenereal) Treponematoses

It is interesting to read about the experimental production of tumours of the kidney in animals. The different treponemal species causing venereal and nonvenereal treponematoses are morphologically and serologically identical and induce comparable histopathological changes.
