

# Functional morphology of the endocrine heart

Steinkopff - Functional morphology and patterns of blood flow in the heart of Python regius

Description: -

- Myocardium -- Congresses.  
Hormones -- Congresses  
Heart -- Metabolism -- Regulation -- Congresses  
Heart -- History -- Congresses  
Cardiovascular system -- Physiology  
Functional morphology of the endocrine heart  
-Functional morphology of the endocrine heart  
Notes: Includes bibliographical references.  
This edition was published in 1989

## The endocrine function of the heart

Adenohypophysis anterior lobe The anterior lobe is divided into pars dorsalis, pars intermedia and pars tuberalis. The infundibular recess displays a characteristically folded wall, namely the neurohypophysis.

## Endocrine Glands: Hormones, Functions and Disorders

Fibrinogen and plasminogen activator inhibitor PAI-1 Abnormalities in coagulation factors suggestive of a defective fibrinolytic system, elevated tissue PAI, fibrinogen, and factor VII, have been reported in GHD adults. Hypertension is the clinical hallmark of PA, with the prevalence of PA reported as 0.

## Heart Endocrine Function

While it is clear that such a response would be critical for survival for our ancestors, who lived in a world full of real physical threats, many of the high-arousal situations we face in the modern world are more psychological in nature. Treatment options include transsphenoidal surgery, unilateral or bilateral adrenalectomy, radiotherapy and medical therapy.

## The Nervous System and Endocrine System

The effect of GH dose on the cardiac response in GHD has not been investigated so far. Pulmonary edema results from increased pulmonary capillary permeability, increased peripheral vascular resistance, increased hydrostatic pressure, and overfilling or constriction of efferent pulmonary veins. Some are mixed glands both endocrine and exocrine in function.
