Description and effects of 1988 drought on ground

JRFit procedure was applied to quantify significant differences in streamflows, baseflows, and low flow statistics during non-irrigation NI and irrigation IR periods associated with ENSO phases. There was no significant change in unit-area discharge between the two stations during 1981.

Effects of the drought of 1980

The applied growth regulators maintained the water budget of canola plants, augmented the accumulation of osmolyte proline and protected photosynthetic pigments from adverse effects of drought stress. Heavy rain does not recharge groundwater aquifers as much as the same amount of rain over longer periods would.
