Crop water requirements and irrigation time. Fields in the vicinity of bush land will be well served by wild pollinators. The CWSI is a simple criterion for identifying potential evaporation state and is used to estimate the soil-induced plant-water stress and is based on the relationship between the canopy-air temperature differential $T_c - T_a$ and the vapor pressure deficit of the air.

Birdsfoot trefoil is an old forage with a new twist

Birdsfoot trefoil seems to be a promising forage crop for Wyoming producers. Early spring planting is preferable because of ample soil moisture for germination and seedling development.
