occurs in lymphoid tissues spleen or lymph nodes , most notably on stimulation by a foreign antigen.

Capillary

Glucose, amino acids, and ions—including sodium, potassium, calcium, and chloride—use transporters to move through specific channels in the membrane by facilitated diffusion.

Regulation of Vascular Tone and Capillary Perfusion

The restriction of the vasa vasorum to the outer layers of arteries is thought to be one reason that arterial diseases are more common than venous diseases, since its location makes it more difficult to nourish the cells of the arteries and remove waste products. Conversion of fibrinogen to fibrin occurs.

Cell distribution in capillary networks

For example, when bone marrow forms new blood cells, the cells must enter the blood supply and can only do so through the large openings of a sinusoid capillary; they cannot pass through the small openings of continuous or fenestrated capillaries. Venules A venule is an extremely small vein, generally 8—100 micrometers in diameter. Besides, we also detected an increase of peroxisomes in the infected epithelial cells.
