New study estimates the odds of life and intelligence emerging beyond our planet

Ni se dan cuenta que sí, se parecerán exactamente en su carcasa pero aunque sean idénticos, igual que un coche es igual a otro del mismo modelo, de la misma serie, de la misma fábrica pero cada coche es un coche diferente; su fecha de generación y de caducidad es otra diferente.

Fermi paradox

Large-scale artificial lighting produced by human is detectable from space. A lo más algunas moléculas encriptadas en alguna basura espacial de la que puede que se haya desarrollado en este polígono industrial y en esta fábrica.

Scientists estimate the number of intelligent alien civilizations in the galaxy

Which means it didn't have much time for life to evolve. There is no such thing as a dumb question. These chemical precursors to life are found throughout our solar system, showing up in lunar and Martian samples.

Fermi paradox

It is said that the only source of genetic variation came via random mutation, which is an extremely slow pathway for evolution.

Intelligent Life in the Universe

How often will intelligent aliens behave like the cyanobacteria, consuming resources well past the point of sustainability and poisoning their own environment to the point of uninhabitability? As it turns out, the odds are unimaginably low.

We're all alone: Oxford study says chance of intelligent life elsewhere very low

This is the so-called Paradox. So now we have a request. Such large scale artifacts would drastically alter the spectrum of a star.

Fermi paradox: why haven't we found aliens yet?

If the universe is teeming with life, then where is everybody? I will think about it.
