Early Diversification Patterns of Reduviidae
Our divergence time estimates provide the first glimpses into the timing of evolutionary events in the second largest family of True Bugs, the Reduviidae, and is one of less than a handful of dating analyses for Heteroptera , , Ho SYW, Phillips MJ 2009 Accounting for calibration uncertainty in phylogenetic estimation of evolutionary divergence times.

Comparative morphology of the raptorial leg in thread

The monophyly of all strongly-supported major clades and subfamilies is recovered as well as the paraphyly of Triatominae and the polyphyly of Cetherinae. Our results show that Triatominae are nested within the Zelurus clade that is restricted to the New World, supporting the hypothesis of a

Neotropical origin of Triatominae ,.

Comparative morphology of the raptorial leg in thread

The subfamily Triatominae is paraphyletic with Triatomini being the sister-group to the Opisthacidius + Rhodniini + Cavernicolini clade in the ML analysis. No study has so far addressed the evolutionary history of microhabitat and prey choices or examined the timing of key transitions within assassin bugs.

Emesa mantis

Filesize: 41.76 MB

The transition from predatory to hematophagous life-style is ambiguous under parsimony, lending equal support to two scenarios on the evolution of blood feeding: 1 the switch to hematophagy may have occurred once at the base of the Triatominae + Opisthacidius clade ; larger red arrowhead , with a reversion to generalist feeding behavior in Opisthacidius, or 2 Triatomini and Rhodniini + Cavernicolini may have acquired hematophagy independently ; smaller red arrowhead.
