Conclusions: Our nomogram could more accurately predict recurrence of ICC after hepatic resection than the AJCC staging system. Of the 23 patients, 14 patients in lenvatinib group began to take lenvatinib about a month after LT except for routine treatment, while the other 9 patients in control group received routine treatment and follow-up after transplantation.

Clinical data and demographic characteristics was obtained. The patient characteristics in each group were compared by one-way ANOVA and chi-square tests. The DFS was defined as the period between the day of LT and the day of HCC recurrence confirmed by imaging, while the OS was defined as the duration from LT to death of patients for any reason or to end of follow-up.

Adjuvant Lenvatinib Prevents Recurrence of High

The calibration curve for the prediction revealed excellent agreement between estimation by our stratification system and actual RFS.
