A Homogenization Based Theory for Laminated and Sandwich Beams

Introduction Applications of composite materials to primary and secondary loading carrying structures have more and more increased over the last decades due to their attractive properties in strength, stiffness and lightness. Flux boundary conditions are also called.

[PDF] A homogenization

To this end, we employ a modelling approach that builds upon the recently developed, hierarchical Serendipity Lagrange finite elements. The material property is assumed to be isotropic and varies through the beam depth according to a power-law form

A COMPARATIVE STUDY OF LARGE DEFLECTIONS OF COMPOSITE BEAMS UNDER THERMOMECHANICAL LOADING
