### The Peace River Coalfields

It is thin bedded and commonly markedly banded by the alternation of beds of contrasting colour.

**Vertebrate ichnites from the Boulder Creek Formation (Lower Cretaceous: middle to ?upper Albian) of northeastern British Columbia, with a description of a new avian ichnotaxon, *Paxavipes babcockensis* ichnogen. et isp. nov.**

TOC, however small the quantity, is still an important component because it is the source of the methane. Deposition at this time was also coincident with a regional tectonic downflexing of the North American craton Lambeck et al. Stratigraphy and Sedimentology Notes on the Bullhead Mountain - Peace River Canyon, Carbon Creek Area, Northeastern British Columbia.

### Chapter 21

Front Ranges In the Front Ranges of southeastern British Columbia and adjacent parts of Alberta, coal measures of the Mist Mountain Formation are characterized by broad upright to overturned concentric folds, cut and repeated by major to minor thrust and tear faults, and late extensional faults. Funding was provided by Amarc Resources Ltd.

**Cretaceous (Albian to Cenomanian) biostratigraphic, paleogeographic and paleoenvironmental reconstruction of the northern Western Interior Sea: Yukon, Canada**

Calgary, Canadian Society of Petroleum Geologists and Alberta Research Council, chpt. Cum Workshop on Management and Control of High Gas Emission and Outbursts, Wollongong, 20-24 March, 1995.

### Boulder Creek Formation

Geological Survey of Canada, Memoir 317, 306 p. The relationship between methane capacity, TOC and maturity is due to the influence the evolution of the basin has on the sedimentation and subsidence rates. Core is stored at an airstrip at the confluence of Mississippi Creek and the Halfway River.

**Stratigraphy and sedimentology of the Lower Cretaceous Hulcross and Boulder Creek formations, northeastern British Columbia (Book, 1992) [styleguide.expo.io]**

Coalbed Methane Symposium, Townsville, 19-21 November, 1992. Comagmatic minor intrusions occur throughout the map area, particularly to the east of the Boundary fault. Toward the southwest, Cariboo rocks have been raised locally to amphibolite facies in association with a belt of small plutons at the edge of the area.

**Open Files 2009**

The gold veins, which are discontinuously mineralized faults and fractures southwest of Rossland, contain small shoots of spectacularly high-grade gold mineralization. Elevation control was provided by triple leveling the lines. Southwest winds dispersed volcanic ash bentonites within the Joli Fou and Viking formations across southern Alberta Amajor, 1985.
