interaction. In such settings, family planning programming should engage with the wider community through mass and peer campaign strategies.

Barriers to male involvement in contraceptive uptake and reproductive health services: a qualitative study of men and women's perceptions in two rural districts in Uganda

According to Government data, approximately 40% of fertile women do not use family planning. Integrating men in reproductive health issues will lead to greater uptake of contraceptives and also break the power dynamics and gender norms that discourage contraceptive uptake.

Determinants of modern contraceptive use among sexually active men in Kenya

Dandelion Africa is run by local people within their communities who understand the needs and how best to address them, how to communicate effectively to be a catalyst for positive change in these marginalised areas of rural Kenya. In total five models were fitted as informed by our conceptual framework, Model I assessed the determinants of contraceptive use in relation to socio-demographic factors, Model II controlled for the effects of socio-economic factors, Model III controlled for interaction with the health care system. Contraception was also associated with promiscuity and straying.

Determinants of modern contraceptive use among sexually active men in Kenya

On the one hand, such requests reveal the unmet need of male fertility regulation methods, at least among men who are not opposed to family planning. Margaret, Mehta Manisha, Pulerwitz Julie, Wulf Deirdre, Bankole Akinrinola, Singh Susheela. Similar efforts targeting segments of the population where contraceptive uptake is low are recommended.
