Distribution of prime numbers

.

Prime number theorem

Newman's proof is arguably the simplest known proof of the theorem, although it is non-elementary in the sense that it uses from complex analysis.

number theory

Edwards's book provides the details. For example, the 2×10^{17} th prime number is 8 512 677 386 048 191 063, and $2 \times 10^{17} \log 2 \times 10^{17}$ rounds to 7 967 418 752 291 744 388, a relative error of about 6.

Prime number theorem

Newman gives a quick proof of the prime number theorem PNT.

Compositional Equations

This is showed at: Oguzhan C.

Distribution of prime numbers

These equations has to contain a number and its content other number seperated with a semicolon also.
