

Differences in anticoagulation practice for atrial fibrillation in primary care and a specialist centre.

- - Which is the best service model to ensure that people with atrial fibrillation receive the recommended anticoagulation? — Nuffield Department of Primary Care Health Sciences, University of Oxford

Risk factor	Score
Congestive heart failure	1
Hypertension	1
Age ≥ 75 years	2
Diabetes mellitus	1
Stroke/TIA	2
Vascular disease (prior MI/PAD or aortic plaque)	1
Age 65–74 years	1
Sex category: Female	1

The CHA₂DS₂-VASc score calculates stroke risk in atrial fibrillation. Score of 0 is "low risk" may not require anticoagulation. Score of 1 in males and ≥ 2 in females is "low-moderate" risk and anti-coagulation may be considered as per ESC guidelines. A score of ≥ 2 and ≥ 3 in males and females respectively, is "moderate-high" risk and anticoagulation is indicated. Maximum possible score = 9; TIA-transient ischaemic attack; MI-myocardial infarction; PAD-peripheral arterial disease.

Description: -

-Differences in anticoagulation practice for atrial fibrillation in primary care and a specialist centre.

-Differences in anticoagulation practice for atrial fibrillation in primary care and a specialist centre.

Which is the best service model to ensure that people with atrial fibrillation receive the recommended anticoagulation? — Nuffield Department of Primary Care Health Sciences, University of Oxford

It is more common in malnourished people, diabetes, HIV, renal failure, alcoholism, pregnancy and in breast feeding women. There are many patients who are not on mood stabilisers or clozapine who require intensive input and combined medical expertise and rotating between posts would offer valuable experience. If anything, policy makers, clinicians, managers, carers and user groups need to collaborate and clamour for a more integrative mental health service, not fracture the already fragile set-up.
