Spinal anesthesia

Glycopyrrolate was shown to be better than placebo in reducing nausea during cesarean section, although the rate of nausea was still high 42%.

Evaluation of orthostatic blood pressure testing as a discharge criterion from PACU after spinal anesthesia

Recent studies suggest that low-dose chlorprocaine 40-60 mg produce excellent short-duration spinal anesthesia. MRI can also aid in assessment of the age of the hematoma Figure 1.

What is Spinal Anesthesia: Benefits and Side Effects

However, due to body habitus, this may not be possible.

Evaluation of orthostatic blood pressure testing as a discharge criterion from PACU after spinal anesthesia

Spinal anesthesia is done in a similar way. With tetracaine, TNSs occur at a lower rate than with lidocaine spinal anesthesia. Figure 14 depicts successful performance of a paramedian spinal anesthetic.
