Epidemiology of lower respiratory tract infections

In adults, the reported incidence is approximately 1. Primary atypical pneumonia is caused by *Mycoplasma pneumoniae*. These patients will need intravenous antibiotics if they are unable to tolerate oral medicines or there is associated vomiting.

Respiratory Tract Infection

Streptokinase activates plasmin, which leads to degradation of fibrin and, in turn, dissolution of blood clots, which assists in the spread of the pathogen.

[Full text] Management of respiratory tract infections in children

The cells are phagocytized by macrophages but can survive and multiply within these phagocytes because of the protection by the waxy mycolic acid in their cell walls. Signs of deterioration should be explained and the family should be informed of any hospital follow-up that has been arranged.

Bacterial Infections of the Respiratory Tract

Figure 1 Reasons for increased vulnerability in children with respiratory tract infections. Travel facilitates the spread of cluster epidemics such as influenza and legionellosis, and is associated with an increased risk of infection with M.

Epidemiology of lower respiratory tract infections

This can lead to recurring and chronic earaches, which are especially common in young children.
