One reason for a large difference in mortality rate and incidence between developed and undeveloped countries is that gastric cancer is one of a few cancers with can develop due to an infection H pylori , and therefore without treatment of the underlying infection, more cancers can develop. The incidence varies highly across different geographic locations, with much higher rates 5 times higher seen in Japan, Finland, Chile, and Iceland than in the United States. Although better therapy for patients with the HIV virus has reduced the number of patients with AIDS, CMV esophagitis may occasionally develop in patients who receive steroids or bone marrow transplants.

### **Article**

The main portal vein splits into the right and left portal vein, then further branches into venules along with a hepatic arteriole and bile duct, forming a portal triad , and ultimately terminating in the liver sinusoids. These abnormalities may be associated with radiographic findings that strongly suggest the underlying cause of disease. There are eight segments, each with its own arterial supply, venous drainage, and biliary outflow.
