5.1.6. ALTERNATIVE METHODS FOR CONTROL OF MICROBIOLOGICAL QUALITY

The following chapter is published for information.

1. GENERAL INTRODUCTION

The objective of this chapter is to facilitate the implementation and use of alternative microbiological methods where this can lead to efficient microbiological control and improved assurance for the quality of pharmaceutical products.

Description: -

Compendium of Methods for the Microbiological Examination of Foods

Pyruvate and catalase degrade peroxidases and it is thought that MI cells lack the ability to degrade these toxic oxygen derivatives.

Microbiological assay and methods

This applies not only to what should be tested and when, but also to the methods that should be used.

Validation of Microbiological Methods

The agar triple-sugar iron TSI is one of the culture media used for the differentiation of most enterobacteria.

Approved CWA Microbiological Test Methods

Toronto: University of Toronto Press, 1986. Further specificity can be introduced by using a medium diagnostic for β -glucuronidase activity; an enzyme possessed by most, but not all, strains of E. Accordingly, this will help understand the sampling procedure to be performed, the type of samples to be collected, the particular test method to be used, and appropriate actions to be taken before and after the test results are attained.

Validation of Microbiological Methods

Conventional microbiological testing of food typically encompasses culture-based techniques with selective agars, or other biochemical assay techniques. ADVERTISEMENTS: Generally it is assumed that those cells which fluoresce yellow are viable while those that fluoresce green are non-viable.
