

Comparison of hemodynamic responses to arm and leg exercise of the same intensities

University of Oregon, College of Human Development and Performance - Eccentric Muscle Contractions: Risks and Benefits

Description: -

-comparison of hemodynamic responses to arm and leg exercise of the same intensities

-

Microform publicationscomparison of hemodynamic responses to arm and leg exercise of the same intensities

Notes: Thesis (M.S.), University of Wisconsin-Madison, 1983.

This edition was published in 1983

Potential causes, mechanisms, and implications of post exercise hypotension

The molecular bases of training adaptation. Muscle as an endocrine organ: focus on muscle-derived interleukin-6.

Potential causes, mechanisms, and implications of post exercise hypotension

Muscle damage following repeated bouts of high force eccentric exercise.

Eccentric Muscle Contractions: Risks and Benefits

In the short term, found four sets of four different lower limbs exercises to affect both large and small artery compliance. Muscular adaptations after two different volumes of blood flow-restricted training.

Blood Flow Restriction Exercise: Considerations of Methodology, Application, and Safety

This theory initially proposed by suggests that during eccentric contractions, the weakest sarcomeres or even half-sarcomeres will absorb most of the length change. Such muscle soreness typically appears 12—24 h after unaccustomed eccentric exercise, peaks at between 24 and 72 h before progressively subsiding and disappearing within 5—7 days post-exercise.

Potential causes, mechanisms, and implications of post exercise hypotension

The threat of the systemic pressure not meeting new regulatory set-point during exercise is compensated by an increased CO and sympathetic vasomotor tone.
