## LOCUST BORER, *Megacyllene robiniae* Forster

*Megacyllene robiniae* Pest description and damage The adult locust borer is a conspicuous and brightly colored beetle.

### *Robinia pseudoacacia*

By the time its trunk is about four inches in diameter, for example, the locust borers have moved in.

### Insect and Mite Pests of Honeylocust

It may also resemble , which has smaller flower spikes and lacks spines. It always pays to look around. The flowers tend to last longer than on the wild tree.

### What insect is this? : Garden : University of Minnesota Extension

Natural spider mite predators predatory bugs, predatory thrips often contribute to a great reduction of mite populations by late August, but chemical controls may be needed to prevent injury.

### Locust Borer

The spray applications should thoroughly wet the bark surface.

### SoJo Garden: The aka What's Killing My Tree!

Honey locust borer *Agrilus difficilis* attacks large and small honey locust trees, as well as branches more than 2 inches in diameter. Dormant season oil treatments also can suppress honeylocust spider mites.
