Meth in Physics Research A 608, 2009 Durability of targets and window foils irradiated by intense heavy ion HI beams in the experiments on synthesis of superheavy nuclei SHN carried out in Dubna with Gas-Filled Recoil Separator DGFRS has been considered. Mathematical background at the level of differential equations should be sufficient for most applications. It is apparent from the variety of barriers available for a hazard control that some barriers will be more successful than others in providing protection.

The resulting dynamic images show differential contrast enhancement of both distal airways and the lung periphery, unlike static hyperpolarized ^3He MR images on which only the lung periphery is seen. For oxygen and nitrogen targets of BeO and BN were used, again with their natural abundances. Neglecting the high-energy amplitude modes, we find that one of the three spin-orbit Goldstone modes in $^3\text{He-B}$ couples to the surface Majorana fermions. Knutson, Phys Rev C 67, 027001 2003 , which seem most sensitive to A_{xx} and A_{yy} at the lowest of these energies. Previously, we detected cell chirality with an in vitro micropatterning system.
