#### What is Pro

Even so, the model produced interesting output, and by attracting considerable attention is probably the best candidate for the title of ancestor of all subsequent microsimulation models of fertility. Steven Mosher did a study of a village at the Guangdong Pearl River Delta from 1979-1980 to shine some light on the methods local communes were using to hit growth targets and, no surprise, they were coercive and awful. Although there have been anecdotal media reports that austerity and recession triggered a rise in abortions, especially in hard-hit countries such as Portugal and Spain, to our knowledge, there has yet to be a rigorous analysis of available abortion data across Europe.

# Chapter 4. Abortion in Fact: Levels, Trends and Patterns. (Induced Abortion).

Sign the petition for reproductive rights in Europe Abortion is still banned in Ireland and Malta, and highly restricted in Hungary and Poland. Controlling for economic growth, which tends to reduce fertility in and of itself, it has been estimated that family planning programs have been responsible for approximately 43 percent of the decline in world fertility during the period 1965—1990. To achieve their desired fertility, women use a combination of contraception and abortion, and some societies also place constraints on marriage and sexual activity.

# **Abortion and Family**

The rate of contraceptive use among married women under the age of 50 increased steadily in Japan from around 20 percent in 1950 to 62 percent in 1979 Kobayashi 1990. The variety stems both from the widely varying forms in which data are available and from the nature of the phenomena themselves.

### **Induced Abortion**

For Slavic women seeking abortions outside the urban centers with state-run providers, there were still numerous back-alley abortions; plus doctors turned away women past 1st trimester, who had one of several potentially dangerous medical conditions, or were pregnant with their 1st child.

# **Abortion in Hungary**

Excess abortions between 2010 and 2012 totaled 10.

# Recent Trends in Abortion Rates Worldwide. (RESEARCH NOTE).

In most countries the use of contraceptives increased, modern contraceptives such as the IUDs and oral contraceptives found extensive application, and female as well as male contraceptive sterilization was widely adopted, although differences between countries were considerable.

# 6 Creative Ways Countries Have Tried to Up Their Birth Rates

Government officials and Chinese medical professionals deny that women are ever forced to have an abortion. It is common during periods of rapid fertility decline for populations to increase their use of both abortion and contraceptives to meet the desire for smaller families and to time births more exactly.
