Panel Data Models: Some Recent Developments

Density Estimation for Statistics and Data Analysis. A number of identification results for limited dependent variable models with fixed effects and strictly exogenous variables are available in the literature, as well as some results on consistent and asymptotically normal estimation of such

models.

There is a trade-off between robustness and efficiency since assumptions of stationary initial conditions or time series homoskedasticity can be very informative, but estimators are not robust to their violation.

Practical problems have always led statisticians to invent estimators for such intermediate models, but it usually remained open whether these estimators are nearly optimal or not. Cambridge: Cambridge University Press, pp. Asymptotic bounds for the concentration of estimator-sequences.

Estimation in semiparametric models (1990 edition)

This chapter reviews the recent developments in the estimation of panel data models in which some variables are only partially observed. We discuss the implications of assuming that explanatory variables are predetermined as opposed to strictly exogenous in dynamic structural equations with unobserved heterogeneity.

This chapter focuses on two of the developments in panel data econometrics since the Handbook chapter by Chamberlain 1984. © Oxford University Press, 2018. We also discuss the identification problems that arise in models with predetermined variables and multiple effects.
